

### **KEY FEATURES**

- Full Season Performance
- Medium-Late Maturity
- High Digestibility

#### SOLD SEASON-LONG PERFORMANCE

Mantis grows quickly and provides abundant leafy forage throughout the peak cool-season forage window. Mantis can provide both early growth as well as sustained season-long forage production.

#### **MEDIUM-LATE MATURITY**

Mantis is ideally matched for the primary cattle production areas of the south. Bred to provide peak performance midseason, Mantis doesn't start too early and doesn't continue on too long, rather, it is just right for providing abundant grazing and multiple high-tonnage hay cuttings over the course of the cool-season production spring season.

#### **MULTI-PURPOSE**

**Grazing:** Expect solid, consistent animal gains when grazing Mantis, especially when practicing rotational grazing. Mantis is safe for all livestock and can be planted straight or with other grasses and legumes.

Hay and Silage: Mantis can provide multiple harvests all season long, as well as a valuable large late season single-cut for silage production with abundant yields and tetraploid-quality feed value.

**Wildlife:** Tetraploid-sweet Mantis is a great addition to wildlife blends. Mantis can draw in the fall game, as well as feed next year's targets with abundant spring forage production.

### **PLANTING INSTRUCTIONS**

#### **Prior to Planting**

For optimal performance, prior to planting, obtain a soil test. Amend soil according to recommendations and fertilize after planting according to recommendations and use.

## When to Plant

Plant in the fall as adequate moisture is available to obtain maximum forage yields. If planted at other times of the year, performance will be limited.

#### **How to Plant**

Mantis can be drilled or broadcast into either a prepared seedbed or an existing sod bed. For prepared seedbed, lightly disc and pack well. For existing sod bed, reduce existing sod height as much as possible

## Seeding Rate

New Pastures: 25–35 lbs/ac Overseeding: 10–15 lbs/ac

#### **Other Information**

Planting Depth 1/8"-1/2" Optimal pH Range 6.0–7.0 Germination 5–10 days

#### **Fertilization**

Apply per soil test recommendations at time of planting and after each cutting. Use of legumes can reduce applications of commercial nitrogen.
